AIDS.

AIDS is a chronic disease caused by HIV infection. It weakens the immune system, making the body vulnerable to various infections, e.g., tuberculosis, pneumonia, etc. The virus attacks the white blood cells, HIV, the basic genetic material, from the outside, and the immune system is unable to fight off the infection, e.g., tuberculosis, pneumonia, etc. The virus attacks the white blood cells, HIV, the basic genetic material, from the outside, and the immune system is unable to fight off the infection, e.g., tuberculosis, pneumonia, etc.

The book offers just the life more
That previous life more
A life more and sweeter
Love and caring
Participation, planning and persistence
A life more respectful.

Nothing stays EXCEPT SUCCESS
Dr. A. K. Banerjee

World Bank estimates that if India continues the current high fertility at 2.7%, this AIDS epidemic will increase the Govt. expenditure by \$2 million per year by 2010. AIDS has no cure. In rural Punjab, only 45.2% even-married women and 61% even-married women of 15 to 49 years of age are aware of AIDS. Awareness generation and dissemination of preventive knowledge is the only long-term cost-effective remedy. This requires educated teacher-volunteers with adequate knowledge and counseling skills. Dooring education amongst high-risk groups, awareness campaigns through the socio-cultural communication and low-cost formal and non-formal education are the possible preventive steps. This is where the social worker, the TEACHER with a social obligation can play a prominent role.
